Topic: Artificial Intelligence

GitHub link : https://github.com/ahmedeldola/ECE001

GitHub page: https://ahmedeldola.github.io/ECE001/index.html

Application brief:

Artificial intelligence is one of the most important topics in life now. We must give it great importance. Artificial intelligence has many applications, including:

. autonomous vehicles (such as drones and self-driving cars).

. medical diagnosis.   . creating art (such as poetry).

. proving mathematical theorems   . playing games (such as Chess).

. search engines (such as Google search)

• online assistants (such as Siri)

• image recognition in photographs spam filtering targeting online advertisements

• Telecommunications maintenance

• Online and telephone customer services

- Advantages of Artificial Intelligence

Artificial Intelligence is a system's ability to correctly interpret external data, to learn from such data, and to use those learnings to achieve specific goals and tasks through flexible adaptation.

Artificial Narrow Intelligence	Artificial General Intelligence	Artificial Super Intelligence
ANI	AGI	ASI
is also referred to as Narrow AI or Weak AI. This type of artificial intelligence is one that focuses primarily on one single narrow task, with a limited range of abilities. If you think of an example of AI that exists in our lives right now, it is ANI. This is the only type out of the three that is currently around. This includes all kinds of Natural Language or Siri.	technology would be on the level of a human mind. Due to this fact, it will probably be some time before we truly grasp AGI, as we still don't know all there is to know about the human brain itself. However, in concept at least, AGI would be able to think on the same level as a human, much like Sonny the robot in I-Robot featuring Will Smith.	This is where it gets a little theoretical and a touch scary. ASI refers to AI technology that will match and then surpass the human mind. To be classed as an ASI, the technology would have to be more capable than a human in every single way possible. Not only could these AI things carry out tasks, but they would even be capable of having emotions and relationships.

1642 First mechanical calculating machine built by French mathematician and inventor Blaise Pascal.

1837 First design for a programmable machine, by Charles Babbage and Ada Lovelace.

1943 Foundations of neural networks established by Warren McCulloch and Walter Pitts, drawing parallels between the brain and computing machines.

1950 Alan Turing introduces a test—the Turing test—as a way of testing a machine's intelligence.

1955 'Artificial intelligence' is coined during a conference devoted to the topic.

1965 ELIZA, a natural language program, is created. ELIZA handles dialogue on any topic; similar in concept to today's chatbots.

2009 Google builds the first self-driving car to handle urban conditions.

2002 iRobot launches Roomba, an autonomous vacuum cleaner that avoids obstacles.

1997 Computer program Deep Blue beats world chess champion Garry Kasparov.

1980s Edward Feigenbaum creates expert systems which emulate decisions of human experts.

2011 IBM's Watson defeats champions of US game show Jeopardy!

2011–2014 Personal assistants like Siri, Google Now, Cortana use speech recognition to answer questions and perform simple tasks.

2014 Ian Goodfellow comes up with Generative Adversarial Networks (GAN).

2016 AlphaGo beats professional Go player Lee Sedol 4–1.

2018 Most universities have courses in Artificial Intelligence.
